To whom it may concern

This is to confirm that the Zoological Society of London is keen to support and contribute to the work of IBISCA in the future.

We feel that such systematic, taxa-wide studies of the patterns and distribution of rainforest biodiversity are essential for a research programme investigating ecosystem function. Such research will also provide a valuable source of data into evolutionary processes generating and maintaining biodiversity, and the way that such biodiversity affects responses to climate and habitat change.

Yours sincerely

Dr Jonathan Bridle

ZSL Research Fellow
